INTRODUCTION

Roundhead valves are used in bulk handling industries as on/off controls for powder, pellets or granules falling under gravity from one discharge point to another.

They are designed specifically to give a full bore opening in pressure applications and are particularly suited to handling abrasive products, slurries and cohesive products.

CONSTRUCTION

The valve consists of a cast body and inlet flanges with an internal cast dome and inflatable seal. The castings are CNC machined to ensure that the seal is properly seated and presses uniformly against the dome when inflated. The dome is clamped to side shafts which operate within impregnated bush bearings in the body with external lubrication points. Lip seal shaft seals protect the environment against product leakage and maintain any internal pressure.

OPERATION

A pneumatic quarter turn actuator is directly coupled to the drive shaft and dome. Air supply to the actuator is via a solenoid valve, flow regulators and piping. The flow regulators are fitted and set to restrict the dome operation speed to less than 1m/s.

Limit switches are fitted and positioned to indicate open/ closed conditions.

OPTIONS

- Cast Iron, Aluminium, Stainless Steel or Carbon Steel construction
- Seal options

- Actuation options
- Tungsten Carbide, Hard Chrome or PTFE Dome coatings
- Pressure differentials
 - Operating temperatures
